

ABSTRACT OF THE DISCLOSURE

A device for evenly coating the internal surfaces of a body cavity, such as genital areas, which is at least partially insertable into the cavity, following which the device is simultaneously manually squeezed while rotating the device to cause dispensing of the coating in an even spiral path as the device is slowly withdrawn from the cavity. In one embodiment, the device is a blow-molded capsule having a neck portion from which a laterally-extending hollow tube projects. In the second embodiment the device is somewhat larger with the medicament container being of rigid cylindrical configuration, and is provided with a manually operable pump having a laterally-extending orifice.
